

NOVEMBER 2019

METDESK MONTHLY SUMMARY

November started off on a mild note, with maximum temperatures widely reaching the mid-teens Celsius across much of the UK. Bude, Cornwall recoded a high of 16.1°C on the 1st. A deep area of low pressure tracked eastwards across the UK on the 2nd producing some strong winds on its southern flank. Peak wind gusts widely in excess of 45-55mph were recorded through southern counties of England, with a maximum gust of 82.9mph recorded at Plymouth, Devon. Gusts in excess of 70mph were also recorded at Southampton, Hants and Berry Head, Devon. The brisk winds felled numerous trees and brough power outages across Devon. Further areas of low pressure continued to track across the country during the next couple of weeks, although winds became predominantly north or north-westerly between the 8th and the 19th. This period saw colder than average temperatures for most, with overnight frosts and occasional spells of sleet and snow in the north. As high pressure built between the 17th and 19th this brought some drier and settled conditions but also some widespread frost, with some of the lowest temperatures of the month being recorded. Braemar, Aberdeenshire saw a minimum of -9.9°C on the 19th. Unsettled conditions returned from the west on the 20th as a large and complex area of low pressure advanced from the west, with further areas of low pressure spreading eastwards during the closing week. Temperatures overall for November ranged between -0.6°C and -1.2°C across the country. Scotland seeing the coldest anomalies and also the driest due to an often southerly tracking jet stream, with England and Wales both receiving above average rainfall.
